## Homework Assignment 6

### Reflection

Starting before this class and while doing this assignment, I was not very familiar with incorporating javascript into my code as well as just javascript concepts in general. Therefore, I had issues in understanding and knowing which functions to use. I also realized that throughout this process, there are many different ways that someone can code in order to get the same end product; some are more efficient than others but in the end it comes down to how someone approaches the problem and how it is solved. I also faced some issues in reordering / reorganizing divs as well as classes and IDs. One way that I was able to overcome these challenges was to write everything out on my iPad and have my code mapped out more visually for me to understand. This helped me clear my thoughts and helped me to better organize my code and understand how I can incorporate the JS through ID classifications. Throughout this process, I better learned and understood the concepts of IDs and classes throughout this process since I didn't really incorporate them as much as I did before, but I began to see the differences in how they're used. Overall, this was a good learning experience in using JS.
